

- 1.) Some files and directories are hidden by default – maybe there's an option for the `ls` command that might show them? Try starting inside the home directory
- 2.) Files have owners, but they may also belong to a particular user group. What `ls` options might display this? Try this on files in the home directory
- 3.) To run `sscripts`, they need to first be made executable. Maybe there is a command that will do this?
- 4.) How can we search a long file like `file.txt` for a particular keyword?
- 5.) Try looking in the top level directory
- 6.) Config files are usually all kept within a particular directory. Where might the `sshd_config` file be?
- 7.) The music folder contains a compressed file. Are there commands that can unzip these?
- 8.) Try displaying **all** processes.
- 9.) What other users are there on the system – there might be a config file that will display this
- 10.) The `history` command can be modified to print the entire history of input commands. Perhaps the guest user previously input a flag code?
